

Securing macOS

What is SentinelOne macOS offering?

SentinelOne macOS agent is securing organizations for the last three years, implementing Static AI, Behavioral AI and Visibility to ensure protection from any attack vector. Organizations are not homogeneous in their devices, often using computers, operating systems, and servers from a variety of vendors. As a result, unified cross-platform protection and visibility into threats across all platforms and devices are more important than ever before.

Main benefits

- Pre-execution and post-infection: Increased visibility into the endpoints
- Focused on stability and decreased attack surface
- Core components are separated and sandboxed to enforce security.
- In-process anti-exploitation for macOS (ROP & stack pivot detection)
- ROP and stack pivot detection enables stopping and reporting exploits as they occur on the running system, even if the exploit itself isn't known.
- Tamper-resistant
- Autonomous, protects in offline mode

Selected by Microsoft to protect the ATP customers

SentinelOne and Microsoft have partnered to integrate SentinelOne Endpoint Protection with Microsoft Windows Defender Advanced Threat Protection. The integration allows SentinelOne and Microsoft customers to autonomously prevent, detect, and respond to the most advanced cyber-attacks not only on Windows endpoints - but also on Mac and Linux endpoints - directly from the Microsoft WD ATP Management Console.

From AV Test report

SentinelOne was able to fend off all attackers 100 percent, resulting only in an additional system load of one second. The protection provided by ESET and Sophos is impeccable as well, but it requires 3 to 5 percent more resources.

ProteQtor IT Security is reseller van SentinelOne. Wij leveren u de software, helpen met de implementatie en geven u advies.
